Continuous Delivery Defined

Continuous Delivery is a software development discipline where you build software in such a way that the software can be released to production at any time.

-Martin Fowler

Deployments Today

Stressful
Frightening
Error prone

Continuous Deployments

Practice makes ~perfect

Better responsiveness

More control

Less stress

Techniques

Feature Toggles

Automated Testing

Continuous Integration

Automated Deployment

Ops Integration
(DevOps)

What It Is ...and Isn't

Can you deploy to production today?

Is anyone freaking out?

Does everyone collaborate on getting solutions out?

Including those "operations" people?

Is the process automated?

How much "magic" is involved?

Continuous Integration -> Continuous Delivery -> Continuous Deployment

Deployment Pipeline

Build

SSDT / dacpac for databases

MSBuild Tasks for SSIS

Get code from http://sqlsrvintegrationsrv.codeplex.com/

Update references and change code signing

Build for your version

Copy to appropriate VS Private Assemblies folder

"C:\Program Files (x86)\Microsoft Visual Studio
12.0\Common7\IDE\PrivateAssemblies"

Test

SSDT for stored procs

ssisUnit for SSIS

http://ssisunit.codeplex.com

Download for your version

ssisUnit for comparing result sets

Deploy

SSDT / dacpac for databases and data
MSBuild Task for SSIS

Demo

Challenges

Schema Changes

   View Layer

Data Migration

Feature Toggles

Rollbacks

Best Practices

Compile to artifact, deploy that artifact

Deploying to test and production should use the same process

Tools should support bundling changes

Any issues in the deployment pipeline are top priority
